

Coupling Tag for N5450B Extreme Temperature Cable Extension

To ensure a high-quality measurement, the N5450B cables have been phase-matched at the factory. A coupling tag is included to ensure that the cables stay as a matched pair.

To install the coupling tag, slip the small end of each cable through the holes in the tag. The tag can be positioned anywhere along the length of the cable and can withstand the temperature ranges specified in the *1168/9A-Series Differential and Single-Ended Probes User's Guide*. The following pictures show how to install the coupling tag.
